

Coupons and Rebates

Numeric Response

1. Coupons and rebates are offered by various stores and businesses to give customers discounts on what they sell. Coupons can be used at the time of the sale. Rebates are given to customers after the sale. A formula to calculate the final price is shown below:

$$\text{Final Price} = \text{Total Selling Price} - \text{Total Savings}$$

Marvin Cornejo purchased a half gallon of milk for \$3.64. He had a store coupon for \$0.45. What was the final price of the milk? Express your answer as a dollar amount to the nearest cent.

2. Coupons and rebates are offered by various stores and businesses to give customers discounts on what they sell. Coupons can be used at the time of the sale. Rebates are given to customers after the sale. A formula to calculate the final price is shown below:

$$\text{Final Price} = \text{Total Selling Price} - \text{Total Savings}$$

Bertha Martinez purchased a half gallon of juice for \$4.92. She had a store coupon for \$0.70. What was the final price of the juice? Express your answer as a dollar amount to the nearest cent.

3. Coupons and rebates are offered by various stores and businesses to give customers discounts on what they sell. Coupons can be used at the time of the sale. Rebates are given to customers after the sale. A formula to calculate the final price is shown below:

$$\text{Final Price} = \text{Total Selling Price} - \text{Total Savings}$$

Lamont Cornejo purchased a half gallon of juice for \$4.25. He had a store coupon for the purchase. If the final price was \$3.85, what was the amount of the coupon? Express your answer as a dollar amount to the nearest cent.

4. Coupons and rebates are offered by various stores and businesses to give customers discounts on what they sell. Coupons can be used at the time of the sale. Rebates are given to customers after the sale. A formula to calculate the final price is shown below:

$$\text{Final Price} = \text{Total Selling Price} - \text{Total Savings}$$
